KAI MOTORS

Incident report/Work plain

Practice of DDos report.

It´s a new middle company. It received suspicious traffic from ICMP attacks.

The company has some security tools, such as Firewall, SIEM and a SOC.

Summary	The SOC reported a DDoS attack to us. All network services suddenly stopped responding. The cybersecurity team confirmed that the disruption was caused by a Distributed Denial of Service (DDoS) attack through a flood of incoming ICMP packets. The team responded by blocking the attack and shutting down all non-critical network services to prioritize the restoration of critical ones.
Identify	Malicious actors targeted the company with an ICMP flood attack, which affected the entire internal network. All critical network resources had to be secured and restored to a fully operational state.
Protect	The cybersecurity team and I implemented a new firewall rule to limit the rate of incoming ICMP packets, along with an IDS/IPS system to filter ICMP traffic based on suspicious characteristics.
Detect	The cybersecurity team configured source IP address verification on the firewall to check for spoofed IP addresses on incoming ICMP packets and implemented network monitoring software to detect abnormal traffic patterns.

Respond	For future security events, our team will isolate affected systems to prevent further disruption to the network. We will prioritize the restoration of any critical systems and services impacted by the incident. Subsequently, we will analyze network logs to identify suspicious or abnormal activity. All incidents will be reported to the supervisor, manager, and the Security Operations Center (SOC).
Recover	To recover from a DDoS attack caused by ICMP flooding, access to network services must be restored to a normal operational state. In the future, external ICMP flood attacks can be blocked at the firewall. During mitigation, all non-critical network services should be temporarily shut down to reduce internal traffic. Once the flood of ICMP packets has subsided, non-critical systems and services can be safely brought back online.
